
Introduction to Parallel Processing

Sequential Processing

- ❑ 1 CPU
- ❑ Simple
- ❑ Big problems???

Application Demands

Challenging Applications in Applied Science/Engineering

- Astrophysics
- Atmospheric and Ocean Modelling
- Bioinformatics
- Biomolecular simulation: Protein folding
- Computational Chemistry
- Computational Fluid Dynamics (CFD)
- Computational Physics
- Computer vision and image understanding
- Data Mining and Data-intensive Computing
- Engineering analysis (CAD/CAM)
- Global climate modeling and forecasting
- Material Sciences
- Military applications
- Quantum chemistry
- VLSI design

Such applications have very high computational and memory requirements that cannot be met with single-processor architectures.

Parallel Processing

Parallel processing is the ability of an entity to carry out multiple operations or tasks simultaneously.

- Parallelism can be achieved within the CPU and with many CPU's.
 - Uniprocessor
 - Multiprocessor

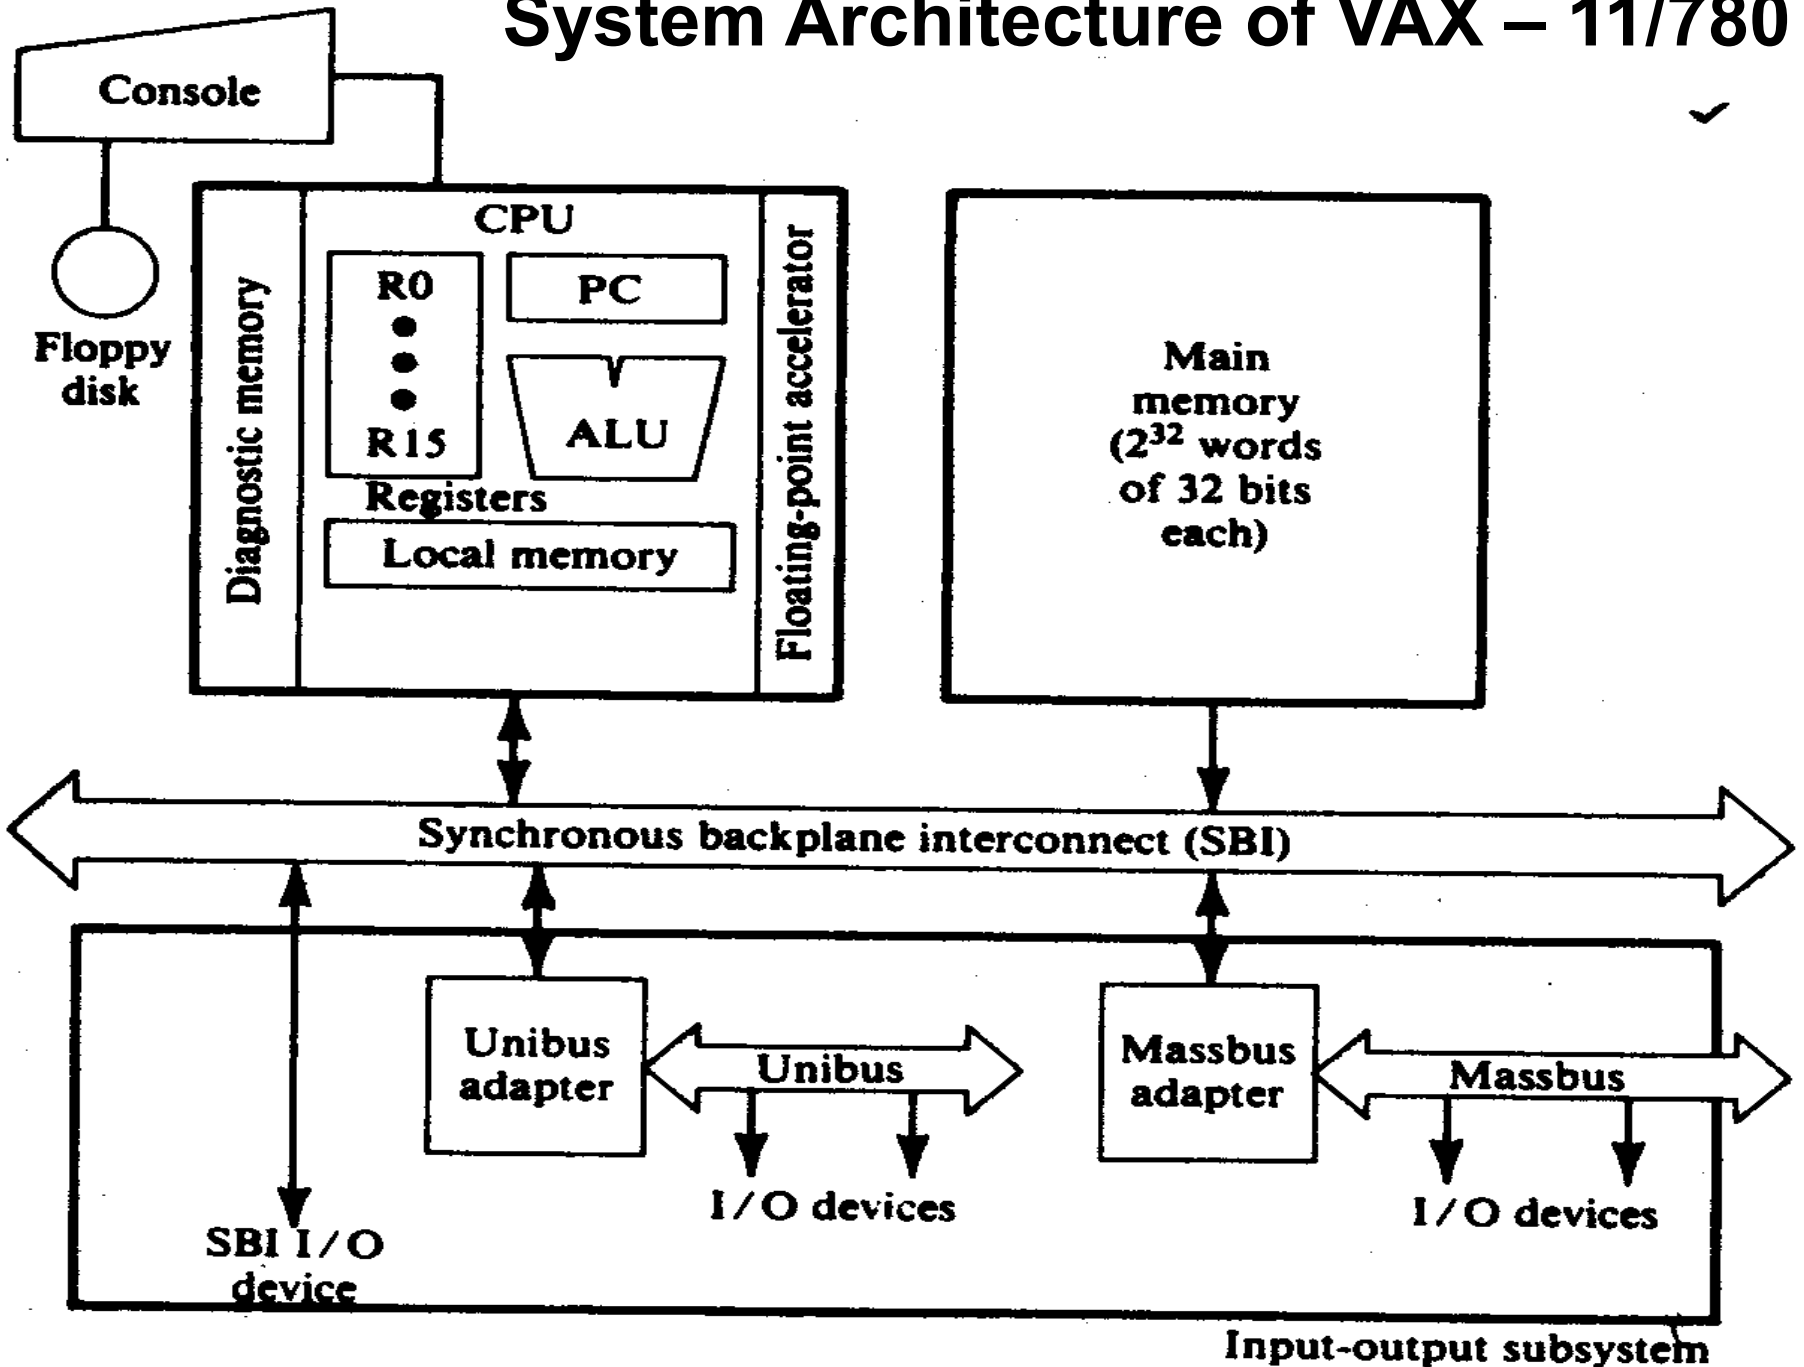

Parallelism in Uniprocessor Systems

Basic Uniprocessor Architecture

- Major Components
 - Main memory
 - CPU
 - I/O Subsystem

System Architecture of VAX - 11/780

System Architecture of IBM System 370/ Model 168
